

PDF Library

Quick start

This add-on stores PDF documents inside Home Assistant and reads them in the browser. It was built for board game rules and appliance manuals: the things you need on a phone, at the table, without hunting through a shared drive.

Collections

Documents live in collections, shown as tabs across the top. A new install comes with two, Board games and Manuals. Use the plus button at the end of the tab row to add your own, and press and hold a tab to rename it, change its icon or delete it.

Adding documents

The Add button opens your device's own file picker, so on a phone you reach iCloud Drive and Downloads directly. On a computer you can also drag PDF files onto the window. Several files at once are uploaded one after another.

For a large import, copy the files straight into the library folder over Samba. The add-on reads the file system on every request, so anything you drop in appears without a restart.

Covers

Each document shows a cover. If you do not supply one, the add-on renders the first page of the document and uses that. Press and hold a cover to set your own image, rename the document or delete it.

Searching

The search field matches document titles across the whole library, not only the collection you are looking at, and results tell you which collection each document belongs to. It does not search inside the documents.

The reader has its own search, the magnifier in its toolbar, which does look inside the open document. Try it on this page: searching for the word collection should find several matches. If it finds nothing here, the reader is at fault. If it works here but not in your own document, that document has no text layer, and no reader can search it.

Reading

Tap a cover to open the document. It opens over the library rather than as a separate page, because inside the Home Assistant app there is no back button to return with. The page you stopped on is remembered, so a long set of rules reopens where you left it.
